

KAMMCO partners with health care providers, integrated delivery networks, independent practice associations, accountable care organizations, health plans and others who face the challenges of the new healthcare marketplace.

KAMMCO offers analytic reporting services required for clinical integration, care coordination and quality reporting.

DATA WAREHOUSE

KAMMCO will build and maintain a data warehouse for your organization or ACO. The data warehouse includes clinical data from your members' EHR systems or HIE as well as claims data and other sources of client data. The data is normalized and populated into a standard data architecture that can be used to create custom reports, registries and benchmarking.

SECURE DATA/SHARED DATA

KAMMCO places high priority on ensuring data is securely stored in the KAMMCO data warehouses. KAMMCO observes HIPAA rules and regulations for all services provided and respects your expressed data sharing preferences. Reports are delivered securely through DIRECT messaging. With consent, KAMMCO will share cohort data, allowing for organizations to realize the benefit of increased care coordination across facilities.

REPORTING

KAMMCO can report on all measures available in your data warehouse at the physician level, organization level, community level or county level. KAMMCO creates a registry or collection of records (data mart) based upon flexible criteria. This could include diagnosis, procedures, allergies, immunizations, medications, labs, reports, encounter information and provider care summaries. This information can be integrated into physician or organization level reports, ACO measure reports, HEDIS reports and quality reports such as PQRS.

Special client features can include custom reports, dashboards and data visualizations to provide quality population analytics in an actionable format.

RISK STRATIFICATION

Aggregate data from your participating facilities is compiled in your data warehouse. The KAMMCO analytics team can produce monthly reports using conditional statements to stratify the patient population. High, moderate and low risk models can be defined and configured based upon your specifications.

KAMMCO can also use the CDC chronic disease indicators to generate reports and registries of patients most at risk for chronic disease including those who could benefit the most from early intervention.

HOTSPOTTING

The data stored in your data warehouse can be used to identify high risk patients in a defined region of your healthcare system as well as patterns of healthcare utilization. Aggregate and de-identified data is used for GIS (geographic information system) mapping. Hotspotting is a valuable reporting measure which can assist you with timely, targeted intervention activities to assist with public and population health management.

"Providing actionable intelligence to providers is crucial to clinical integration and the transition to value-based payment models.

Having the right information at the right time will improve patient care, improve quality, and lower malpractice risk."

Kurt Scott,
KAMMCO
President and CEO

POPULATION HEALTH

KAMMCO provides a wide variety of population health reports based upon the use case and your noted specifications. KAMMCO can aggregate your data according to zip codes for population based reporting. This information is then geo-coded so that a risk picture can be developed.

DISEASE REGISTRIES

KAMMCO can develop patient or disease specific registries for members across all of the participating organizations.

CUSTOM DASHBOARDS

KAMMCO can create customizable dashboards which will allow you to easily view the specific performance measures and patient outcomes within your organization. Dashboards and reports are MS Excel based and include advanced analytics capabilities based on the need as defined by you.

QUALITY METRICS

KAMMCO can provide a quality dashboard for individual physicians and practices based upon preventative care/wellness metrics to encourage analysis of quality indicators and assist in reporting requirements. KAMMCO has developed reports to track ACO metrics to ensure ACO clients have the necessary outcome information to report on the clinical quality measures currently required. Additionally, physician outcomes for PQRS reporting are tracked based upon 2014 quality metrics.

KAMMCO partners with organizations in healthcare transformation, interoperability and the use of patient data to facilitate research and improve patient outcomes across the nation. Call 800.32.2259 to learn more.
